Re: Recommended Torque Specification

Details: When installing the Advent upper unit to the mounting template, we recommend the installer evenly tighten the mounting bolts to a torque specification of **33-35 Inch-pounds**. This torque specification should be used with both the Advent ducted and non-ducted systems.

Notes: The Advent non-ducted manual recommended a torque specification of 40-50 Inch-pounds. This Tech Bulletin supersedes that information.

33-35 Inch-pounds will compress the roof gasket material to the proper level. The bolts are self-locking, so over-tightening is not necessary
